# BIMM 143 Lab 15: RNA-Seq analysis mini-project

Sofia Lanaspa, A17105313

Differential expression analysis project with DESeq2 followed by gene enrichment and functional annotation with KEGG, InterPro, and GO ontologies.

## **Data Import**

Read both csv files and save them into variables

```
metaFile <- "GSE37704_metadata.csv"
countFile <- "GSE37704_featurecounts.csv"

# Import metadata and take a peak
colData = read.csv(metaFile, row.names=1)
head(colData)</pre>
```

```
condition
SRR493366 control_sirna
SRR493367 control_sirna
SRR493368 control_sirna
SRR493369 hoxa1_kd
SRR493370 hoxa1_kd
SRR493371 hoxa1_kd
```

```
# Import countdata
countData = read.csv(countFile, row.names=1)
head(countData)
```

```

## **DESeq Analysis**

Nice now lets setup the DESeqDataSet object required for the DESeq() function and then run the DESeq pipeline.

Warning in DESeqDataSet(se, design = design, ignoreRank): some variables in design formula are characters, converting to factors

```
dds = DESeq(dds)
```

estimating size factors

estimating dispersions

gene-wise dispersion estimates

mean-dispersion relationship

final dispersion estimates

fitting model and testing

#### dds

```
class: DESeqDataSet
dim: 15975 6
metadata(1): version
assays(4): counts mu H cooks
rownames(15975): ENSG00000279457 ENSG00000187634 ... ENSG00000276345
   ENSG00000271254
rowData names(22): baseMean baseVar ... deviance maxCooks
colnames(6): SRR493366 SRR493367 ... SRR493370 SRR493371
colData names(2): condition sizeFactor
```

Get results for the HoxA1 knockdown versus control siRNA (labeled as "hoxa1\_kd" and "control\_sirna" in our original colData metaFile input to DESeq, you can check this above and by running resultsNames(dds) command)

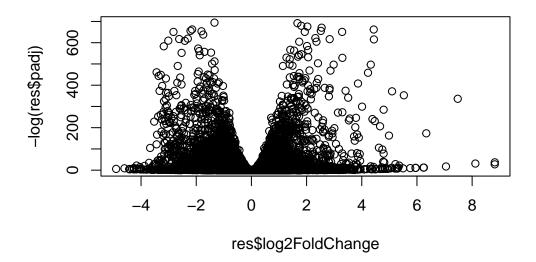

```
res = results(dds, contrast=c("condition", "hoxa1_kd", "control_sirna"))
summary(res)
```

```
out of 15975 with nonzero total read count
adjusted p-value < 0.1
LFC > 0 (up) : 4349, 27%
LFC < 0 (down) : 4396, 28%
outliers [1] : 0, 0%
low counts [2] : 1237, 7.7%
(mean count < 0)
[1] see 'cooksCutoff' argument of ?results
[2] see 'independentFiltering' argument of ?results</pre>
```

## **Result Visualization**

Create a Volcano Plot

```
plot(res$log2FoldChange, -log(res$padj) )
```

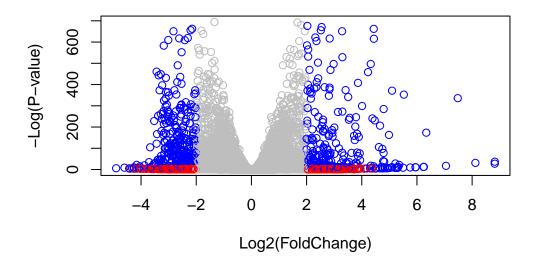

### Add some color

```
# Make a color vector for all the genes
mycols <- rep("gray", nrow(res))

# Override by coloring genes with absolute fold change above 2 (red)
mycols[abs(res$log2FoldChange) > 2] <- "red"

# Color genes with adjusted p-value less than 0.01 and absolute fold change above 2 (blue)
inds <- (res$padj < 0.01) & (abs(res$log2FoldChange) > 2)
mycols[inds] <- "blue"</pre>
```

Plot with color

# **Add Annotation**

Load packages

```
library("AnnotationDbi")
library("org.Hs.eg.db")
```

# columns(org.Hs.eg.db)

[1]	"ACCNUM"	"ALIAS"	"ENSEMBL"	"ENSEMBLPROT"	"ENSEMBLTRANS"

Q. Finally for this section let's reorder these results by adjusted p-value and save them to a CSV file in your current project directory.

```
res = res[order(res$pvalue),]
write.csv(res, file="deseq_results.csv")
```

## **Pathway Analysis**

Here we are going to use the gage package for pathway analysis

Download all packages if you dont have them, type this into console: BiocManager::install( c("pathview", "gage", "gageData") )

Load the packages and setup the KEGG data-sets we need

```
# load packages
library(pathview)
```

Pathview is an open source software package distributed under GNU General Public License version 3 (GPLv3). Details of GPLv3 is available at http://www.gnu.org/licenses/gpl-3.0.html. Particullary, users are required to formally cite the original Pathview paper (not just mention it) in publications or products. For details, do citation("pathview") within R.

The pathview downloads and uses KEGG data. Non-academic uses may require a KEGG license agreement (details at http://www.kegg.jp/kegg/legal.html).

### library(gage)

```
library(gageData)

# data-sets
data(kegg.sets.hs)
data(sigmet.idx.hs)

# Focus on signaling and metabolic pathways only
kegg.sets.hs = kegg.sets.hs[sigmet.idx.hs]

# examine first 3 pathways
head(kegg.sets.hs, 3)

```

We used the map IDs () function above to obtain Entrez gene IDs (stored in resentrez) and we have the fold change research and the stored in research and

```
foldchanges = res$log2FoldChange
names(foldchanges) = res$entrez
head(foldchanges)
```

```
1266 54855 1465 51232 2034 2317 -2.422719 3.201955 -2.313738 -2.059631 -1.888019 -1.649792
```

Let's run the gage pathway analysis

```
# to get the results
keggres = gage(foldchanges, gsets=kegg.sets.hs)
```

Look into gage

#### ?gage

Look at bject returned by gage

```
attributes(keggres)
```

#### \$names

```

```

Now, let's try out the pathview() function from the pathview package to make a pathway plot with our RNA-Seq expression results shown in color.

To begin with lets manually supply a pathway.id (namely the first part of the "hsa04110 Cell cycle") that we could see from the print out above.

```
pathview(gene.data=foldchanges, pathway.id="hsa04110")
```

<sup>&#</sup>x27;select()' returned 1:1 mapping between keys and columns

Info: Working in directory /Users/sofialanaspa/Desktop/BIMM 143 (bioinf)/BIMM143\_Lab14

Info: Writing image file hsa04110.pathview.png

# This downloads the pathway figure data from KEGG and adds our results to it. Here is the de

```
# A different PDF based output of the same data pathview(gene.data=foldchanges, pathway.id="hsa04110", kegg.native=FALSE)
```

'select()' returned 1:1 mapping between keys and columns

Warning: reconcile groups sharing member nodes!

```
[,1] [,2]
[1,] "9" "300"
[2,] "9" "306"
```

Info: Working in directory /Users/sofialanaspa/Desktop/BIMM 143 (bioinf)/BIMM143\_Lab14

Info: Writing image file hsa04110.pathview.pdf

```
## Focus on top 5 upregulated pathways here for demo purposes only
keggrespathways <- rownames(keggres$greater)[1:5]

# Extract the 8 character long IDs part of each string
keggresids = substr(keggrespathways, start=1, stop=8)
keggresids</pre>
```

[1] "hsa04640" "hsa04630" "hsa00140" "hsa04142" "hsa04330"

Finally, lets pass these IDs in keggresids to the pathview() function to draw plots for all the top 5 pathways.

```
pathview(gene.data=foldchanges, pathway.id=keggresids, species="hsa")
```

'select()' returned 1:1 mapping between keys and columns

Info: Working in directory /Users/sofialanaspa/Desktop/BIMM 143 (bioinf)/BIMM143\_Lab14

```
Info: Writing image file hsa04640.pathview.png
'select()' returned 1:1 mapping between keys and columns
Info: Working in directory /Users/sofialanaspa/Desktop/BIMM 143 (bioinf)/BIMM143_Lab14
Info: Writing image file hsa04630.pathview.png
'select()' returned 1:1 mapping between keys and columns
Info: Working in directory /Users/sofialanaspa/Desktop/BIMM 143 (bioinf)/BIMM143_Lab14
Info: Writing image file hsa00140.pathview.png
'select()' returned 1:1 mapping between keys and columns
Info: Working in directory /Users/sofialanaspa/Desktop/BIMM 143 (bioinf)/BIMM143_Lab14
Info: Writing image file hsa04142.pathview.png
'select()' returned 1:1 mapping between keys and columns
Info: Working in directory /Users/sofialanaspa/Desktop/BIMM 143 (bioinf)/BIMM143_Lab14
Info: Writing image file hsa04330.pathview.png
Q. Can you do the same procedure as above to plot the pathyiew figures for the top 5 down-
reguled pathways?
```

```
## Focus on top 5 upregulated pathways
keggrespathways_down <- rownames(keggres$less)[1:5]

# Extract the 8 character long IDs part of each string
keggresids_down = substr(keggrespathways, start=1, stop=8)
keggresids_down</pre>
```

[1] "hsa04640" "hsa04630" "hsa00140" "hsa04142" "hsa04330"

Pass IDs in keggresids to the pathwiew() function to draw plots for all the top 5 pathways.

```
'select()' returned 1:1 mapping between keys and columns
Info: Working in directory /Users/sofialanaspa/Desktop/BIMM 143 (bioinf)/BIMM143_Lab14
Info: Writing image file hsa04640.pathview.png
'select()' returned 1:1 mapping between keys and columns
Info: Working in directory /Users/sofialanaspa/Desktop/BIMM 143 (bioinf)/BIMM143_Lab14
Info: Writing image file hsa04630.pathview.png
'select()' returned 1:1 mapping between keys and columns
Info: Working in directory /Users/sofialanaspa/Desktop/BIMM 143 (bioinf)/BIMM143_Lab14
Info: Writing image file hsa00140.pathview.png

Info: Writing image file hsa04330.pathview.png
```

### **Gene Ontology**

We can also do a similar procedure with gene ontology. Similar to above, go.sets.hs has all GO terms. go.subs.hs is a named list containing indexes for the BP, CC, and MF ontologies. Let's focus on BP (a.k.a Biological Process) here.

```
data(go.sets.hs)
data(go.subs.hs)
# Focus on Biological Process subset of GO
gobpsets = go.sets.hs[go.subs.hs$BP]
gobpres = gage(foldchanges, gsets=gobpsets, same.dir=TRUE)
lapply(gobpres, head)
```

## Reactome Analysis

Let's now conduct over-representation enrichment analysis and pathway-topology analysis with Reactome using the previous list of significant genes generated from our differential expression results above.

First, Using R, output the list of significant genes at the 0.05 level as a plain text file:

```
sig_genes <- res[res$padj <= 0.05 & !is.na(res$padj), "symbol"]
print(paste("Total number of significant genes:", length(sig_genes)))</pre>
```

```
[1] "Total number of significant genes: 8147"
```

```
write.table(sig_genes, file="significant_genes.txt", row.names=FALSE, col.names=FALSE, quote
```

### Save Results

```
write.csv(res, file = "keggrespathways.csv", row.names = TRUE)
write.csv(res, file = "keggrespathways_down.csv", row.names = TRUE)
```
